Institutional Decision Intelligence™ Architecture

The canonical model of how individual judgment becomes statewide intelligence.

Purpose

This document presents the canonical architecture of Institutional Decision Intelligence™. It describes how individual judgment, institutional diagnostics, and statewide coordination combine into a coherent learning infrastructure.

The architecture is a reference model. It is not a technology product, an implementation framework, or a service offering. It describes a way of seeing institutional decision behavior as a measurable organizational capability.

The Architecture

Layer Definitions

Individual Responses

Confidential executive reflections capture how leaders interpret strategic conditions in their own institutional context.

Institutional Diagnostics

Responses are synthesized at the institutional level, producing a Decision Intelligence profile for each participating college.

Scenario Reflection

Structured scenarios surface latent assumptions and reveal where interpretations converge or diverge inside the institution.

Calibration Intelligence

Differences in interpretation become visible — not as conflict, but as the raw material of leadership calibration.

Consensus Mapping

Across the System, areas of shared understanding and meaningful divergence are mapped without exposing institutional identity.

Benchmarking Intelligence

Aggregate patterns establish a statewide reference for governance maturity, calibration capability, and decision coherence.

Statewide Learning Infrastructure

Findings feed a durable learning system that supports continuous institutional sensemaking across the Commonwealth.

Institutional Adaptability

The cumulative outcome: institutions that can interpret change quickly, align judgment coherently, and act with coordinated clarity.

IV

Closing Statement

Institutional Decision Intelligence™ transforms isolated institutional decisions into measurable statewide intelligence.
